

SERVER LOAD BALANCING METHOD AND SYSTEM

ABSTRACT OF THE DISCLOSURE

A method and system for providing a connection between a client and a server with load balancing between servers are disclosed. A computer-implemented method of the present invention generally includes binding a primary virtual server to a set of URLs, each URL having an associated real server and receiving a request from a client for connection to the primary virtual server. One of the real servers are selected for connection with the client and a redirect message is sent to the client specifying the URL associated with the selected real server. The method further includes receiving a new connection request from the client for connection with the selected real server.
